

## ContainerPower Energy Solutions

# Add 20 000 lead-acid batteries for solar base stations

- ✓ **ALL IN ONE**
- ✓ **100Kw/174Kwh  
High Capacity**
- ✓ **Intelligent  
Integration**

## Overview

---

Should I add batteries to my solar system?

If you already have solar, you may be considering adding batteries to your system, whether it's to add savings if you're on a time-of-use rate plan, or to provide backup power if you're in an area prone to grid outages. First, how much can you save by adding batteries, and what's your payback time?

.

What are lead acid batteries for solar energy storage?

Lead acid batteries for solar energy storage are called "deep cycle batteries." Different types of lead acid batteries include flooded lead acid, which require regular maintenance, and sealed lead acid, which don't require maintenance but cost more.

What is a battery-integrated solar system?

A battery-integrated solar system ensures a consistent power supply during blackouts or outages. In addition, it helps you store excess energy, as stated earlier. Adding a battery to your existing solar system for storing energy is called retrofitting.

Why is Battery Integration important for a solar system?

Battery integration enhances the value of a solar system. The addition of batteries allows homeowners and businesses to store excess energy (generated during daytime) for later use. The combination of a solar system and battery reduces dependence on the utility grid and lowers electricity bills.

What is a lead acid battery?

A lead acid battery is a kind of rechargeable battery that stores electrical energy by using chemical reactions between lead, water, and sulfuric acid. The technology behind these batteries is over 160 years old, but the reason

they're still so popular is because they're robust, reliable, and cheap to make and use.

How do you design a battery bank for solar storage?

Designing a battery bank for solar storage is a balancing act of finding the right voltage, the right current, and the right amount of stored energy. Most homes need a total of around 900 kilowatt hours (kWh) of electricity per month, or 30 kWh per day. To serve those needs, you'd need a battery bank capable of storing 625 amp-hours at 48 volts.
