Overview

Can energy storage be reduced in a 5G base station?

Reference proposed a refined configuration scheme for energy storage in a 5G base station, that is, in areas with good electricity supply, where the backup battery configuration could be reduced.

Can a 5G base station energy storage sleep mechanism be optimized?

The optimization configuration method for the 5G base station energy storage proposed in this article, that considered the sleep mechanism, has certain engineering application prospects and practical value; however, the factors considered are not comprehensive enough.

Can a bi-level optimization model maximize the benefits of base station energy storage?

To maximize overall benefits for the investors and operators of base station energy storage, we proposed a bi-level optimization model for the operation of the energy storage, and the planning of 5G base stations considering the sleep mechanism.

Does energy storage optimization affect demand response in 5G base stations?

In summary, currently, there is abundant research on energy storage optimization configuration. However, most of the research on the energy storage configuration of 5G base stations does not consider the factors of participation of energy storage in demand response, and the optimization models are rarely implemented.

What is the inner goal of a 5G base station?

The inner goal included the sleep mechanism of the base station, and the optimization of the energy storage charging and discharging strategy, for minimizing the daily electricity expenditure of the 5G base station system.

What is the sleep mechanism of a base station?

The sleep mechanism of a base station refers to the intelligent shutdown of major power consumption devices, such as the AAU of the base station, when there is no load or the load is low, such that the energy consumption is greatly reduced.
