

ContainerPower Energy Solutions

Container Energy Storage Electrical Design Scheme

Overview

The electrical system should be equipped with a battery management system (BMS) and an energy management system (EMS) to realise real-time monitoring and protection against over-charging, over-discharging, short-circuiting, over-temperature and other conditions. The system should meet IEC 62933, GB/T 36276 and other safety standards for energy storage systems to ensure that the power can be cut off quickly in case of failure and protect the equipment from further damage.
