Energy storage device underground

Overview

The Texas-based startup Quidnet Energy just completed a test showing it can store energy for up to six months by pumping water underground. Using water to store electricity is hardly a new concept—pumped hydropower storage has been around for over a century.

The Texas-based startup Quidnet Energy just completed a test showing it can store energy for up to six months by pumping water underground. Using water to store electricity is hardly a new concept—pumped hydropower storage has been around for over a century.

A recent test shows that Quidnet's technology can store energy in pressurized water underground for months at a time. The Texas-based startup Quidnet Energy just completed a test showing it can store energy for up to six months by pumping water underground. Using water to store electricity is.

One technique is known as pumped storage hydropower: When the grid is humming with renewable power, a facility pumps water uphill into a reservoir. Then, when solar or wind power drops off, the facility lets the water loose to flow back down into another reservoir, turning turbines that produce.

Underground energy storage (UES) is a large-scale engineering solution designed to stabilize electrical grids that rely on variable power sources like solar and wind. Renewable generation fluctuates based on weather, creating periods of energy surplus and deficit. Grid operators must maintain a.

Today, 27 October 2025, the International Gas Union (IGU) has released its Underground Gas Storage - A Critical Pillar for Energy Security Report, using data from the IGU's unique members' database and highlighting the fundamental role of Gas storage as a strategic pillar of the future energy.

Underground gas storage (UGS) remains a critical part of global energy security, according to a new report published by the International Gas Union (IGU). The report, Underground Gas Storage - A Critical Pillar for Energy Security, draws on data from the IGU's members' database and underlines the.

Three Houston startups are using fracking-like techniques to create underground storage caverns for pressurized water, which when released drives a turbine to send power to the grid. Cindy D. Taff, Chief Executive Officer of Sage Geosystems, explains how they use a well to store energy on March 22.
