At COP29, the UK's energy secretary described the move to renewable energy as “unstoppable” – rightly so: renewable energy has proved itself to be a cost-effective, practical alternative to fossil fuels, innovation is rapidly improving, and investment is surging. The UK's commitment to renewable.

Despite a 12% year-on-year fall in the capacity of newly submitted planning applications in 2024, there is still a strong interest in the UK energy storage market as a whole. This article takes a close look into the battery energy storage system (BESS) pipeline, which shows that the future growth.

This post investigates the state of the UK battery storage pipeline, year-to-date figures and an insight into the appetite to develop over time. Battery storage is essential for providing the security and flexibility that will make our future energy system resilient and reliable. Effective use of.

The most immediate and effective response to this challenge lies in battery energy storage systems (BESS). Unlike large-scale transmission upgrades, which require extensive permitting, planning, and capital outlays, BESS can be deployed within 12 months. These systems are flexible in location.

Storing renewable energy in large batteries to help balance the energy market is technically feasible at large scale across the UK and EU, but it needs to overcome financial challenges affecting its long-term business viability, finds a new study by UCL researchers. The giant batteries, which are.
