Industry cost calculation of solar wind power and energy storage

Overview

Table 1 summarizes updated cost estimates for reference case utility-scale generating technologies specifically two powered by coal, five by natural gas, three by solar energy and by wind, two by uranium, and one each by hydroelectric, biomass, geothermal, and battery storage.

To accurately reflect the changing cost of new electric power generators in the Annual Energy Outlook 2025 (AEO2025), EIA commissioned Sargent & Lundy (S&L) to evaluate the overnight capital cost and performance characteristics for 19 electric generator types. The following report represents S&L's.

DOE's Energy Storage Grand Challenge supports detailed cost and performance analysis for a variety of energy storage technologies to accelerate their development and deployment. The U.S. Department of Energy's (DOE) Energy Storage Grand Challenge is a comprehensive program that seeks to accelerate.

In 2023, the global weighted average levelised cost of electricity (LCOE) from newly commissioned utility-scale solar photovoltaic (PV), onshore wind, offshore wind and hydropower fell. Between 2022 and 2023, utility-scale solar PV projects showed the most significant decrease (by 12%). For newly.
