On-site energy storage at solar power stations

Overview

How can on-site solar PV & energy storage improve sustainability?

To achieve sustainability goals while meeting the increasing electricity demands of electrification, organizations are pairing on-site solar PV generation with on-site energy storage. These systems, which are considered as “behind-the-meter” (BTM) systems, allow facilities to maximize the benefits of on-site renewable generation.

Why is energy storage important?

New energy power stations equipped with energy storage systems hold significant application value on the generation side. The deployment of energy storage can effectively address issues such as power output fluctuations, tracking generation schedules, reducing forecast errors, and minimizing wind and solar power curtailment.

Can on-site storage be used alongside solar PV?

If a utility restricts the exports from a facility to the grid, the use of on-site storage alongside solar PV can provide a solution to avoid costly infrastructure upgrades, thus increasing the feasibility of larger on-site PV installations.

What is the optimal energy storage configuration?

Research on optimal energy storage configuration has mainly focused on users , power grids [17, 18], and multienergy microgrids [19, 20]. For new energy systems, the key goals are reliability, flexibility , and minimizing operational costs , with limited exploration of shared energy storage.

What are the benefits of an on-site solar PV system?

For the scenario represented in the graph, an on-site solar PV system allows the facility to reduce the amount of electricity drawn from the grid during the middle of the day. Increasing the amount of solar PV production on-site can provide additional cost and emission reductions and resiliency benefits for

facilities.

What is shared energy storage?

Shared energy storage leverages temporal and spatial reuse, integrating the diverse demands of multiple participants and taking advantage of the complementary nature of these demands to achieve efficient utilization in conjunction with renewable energy. Shared energy storage can be divided into demand-driven and profit-driven models .
