

## ContainerPower Energy Solutions

**Outdoor power supply has high power consumption when running at low power**

## Overview

---

What is an outdoor Uninterruptible Power Supply?

An outdoor Uninterruptible Power Supply is a power solution designed for critical applications where it's essential that equipment stays running in harsh outdoor environments and significant temperature variations, where an ordinary UPS would fail. Trust TSi Power for these applications.

What is the difference between active efficiency and no-load power consumption?

The rules apply to both the active efficiency and the no-load power consumption. Active efficiency is the average efficiency when a power supply is connected to a device, for example a laptop, when it is being used. No-load power consumption is the power consumed when this is plugged into a power outlet but not connected to a device.

What is the new regulation on power consumption?

From April 2020, Regulation (EC) 278/2009 was replaced by Regulation (EU) 2019/1782. The rules apply to both the active efficiency and the no-load power consumption. Active efficiency is the average efficiency when a power supply is connected to a device, for example a laptop, when it is being used.

What is no-load power consumption?

No-load power consumption is the power consumed when this is plugged into a power outlet but not connected to a device. Voltage converters, uninterruptible power supplies, battery chargers, halogen lighting converters and external power supplies for medical devices are excluded from these requirements.

How many external power supplies are there in the EU?

In 2020, 1.7 billion external power supplies (EPS) were in use in the EU27, of which 75% for residential use, on average 6.5 units per EU household. They

converted 48 TWh/a of electricity from the 220V mains to the input needed by the powered products.

How much money will EU27 users save on external power supplies?

In 2020, due to Ecodesign measures, EU27 users saved € 0.9 billion on external power supplies. This is projected to increase to € 1.3 billion in 2030, a 16% saving. In 2030, the annual household expenses for EPS are projected to decrease from € 33 (without measures) to € 28.
