Phase Change Energy Storage Station Operation Plan

Overview

What is phase change energy storage?

Phase change energy storage combined cooling, heating and power system constructed. Optimized in two respects: system structure and operation strategy. The system design is optimized based on GA + BP neural network algorithm. Full-load operation strategy has good economic, energy and environmental benefits.

Are phase change energy storage CCHP systems optimized under full-load operation strategy?

The optimization indexes of the phase change energy storage systems in each climate zone under the full-load operation strategy are shown in Fig. 9. As can be seen from the figure, the energy savings of the phase change energy storage CCHP systems in all five cities are obtained under the full-load operation strategy.

Can phase change energy storage improve energy performance of residential buildings?

This study presents a phase change energy storage CCHP system developed to improve the economic, environmental and energy performance of residential buildings in five climate zones in China. A full-load operation strategy is implemented considering that the existing operation strategy is susceptible to the mismatch of thermoelectric loads.

What is phase change energy storage CCHP system?

In the phase change energy storage CCHP system, energy consumption originates from natural gas and purchased electricity from the grid. Since the measurement units of electricity and natural gas are different, this study uses the primary energy conversion factor to uniformly convert natural gas and electricity into direct energy.

What is the economic optimization metric for phase change energy storage?

This study selects the ATCSR as the main economic optimization metric for the CCHP system with phase change energy storage. The ATCSR is characterized as the ratio of the annual total cost difference between the SP system and the phase change energy storage CCHP system to the annual total cost of the SP system, as stated in .

What is the life cycle cost of energy storage power station?

Taking the energy storage power station with a rated power of 50 MW as an example, as the rated capacity of the energy storage power station increases from 50 to 300 MWh: According to the analysis of Fig. 3 a, the total life cycle cost of EES increased from 174 million yuan to 961 million yuan, an increase of 552.3%.
