Planning and design of energy storage system for Hungarian communication base stations

Overview

Shared energy storage (SES) system can provide energy storage capacity leasing services for large-scale PV integrated 5G base stations (BSs), reducing the energy cost of 5G BS and achieving high effi.

Can shared energy storage system capacity planning and operation be decoupled?

A bi-level optimization framework of capacity planning and operation costs of shared energy storage system and large-scale PV integrated 5G base stations is proposed to realize the decoupling of shared energy storage system capacity planning and operation from 5G base station operation.

What is a 5G base station energy storage device?

During main power failures, the energy storage device provides emergency power for the communication equipment. A set of 5G base station main communication equipment is generally composed of a baseband BBU unit and multiple RF AAU units. Equation 1 serves as the base station load model:.

What is 5G base station load forecasting technology?

The research on 5G base station load forecasting technology can provide base station operators with a reasonable arrangement of energy supply guidance, and realize the energy saving and emission reduction of 5G base stations.

Can partial backup energy storage be integrated into grid dispatch?

Furthermore, references [13, 14] propose the integration of partial backup energy storage in base stations into grid dispatch, resulting in increased economic benefits of base stations and improved stability of the distribution network. However, on one hand, optimization of base station operating modes have limited ability to reduce energy demands.

What equipment is used in a 5G base station?

AAU is the most energy-consuming equipment in 5G base stations, accounting for up to 90% of their total energy consumption. Auxiliary equipment includes

power supply equipment, monitoring and lighting equipment. The power supply equipment manages the distribution and conversion of electrical energy among equipment within the 5G base station.

How much energy does a communication base station use?

In this region, the communication base stations are equipped with energy storage systems with a rated capacity of 48 kWh and a maximum charge/discharge power of 15.84 kW. The self-discharge efficiency is set at 0.99, and the state of charge (SOC) is allowed to range between a maximum of 0.9 and a minimum of 0.1. Figure 3.
