Power Generation Regulations for Grid-Connected Inverters of Communication Base Stations

Overview

New US regulations for grid-tied inverters are set to take effect in January 2026, impacting manufacturers, installers, and consumers by introducing enhanced safety, cybersecurity, and grid support functionalities for a more resilient and modern power system. Can grid-connected PV inverters improve utility grid stability?

Grid-connected PV inverters have traditionally been thought of as active power sources with an emphasis on maximizing power extraction from the PV modules. While maximizing power transfer remains a top priority, utility grid stability is now widely acknowledged to benefit from several auxiliary services that grid-connected PV inverters may offer.

What is grid forming inverter capability?

Grid forming inverter capability can be generally described as the capability of an inverter to support BPS operation under normal and emergency conditions without relying on the characteristics of synchronous machines.

How do I use communication technology to support grid requirements?

Applying the appropriate communication technology to support grid requirements depends upon many factors beyond just the communication technology, how it is deployed (e.g., architecture) and operations. One method is to start with the grid services or processes needing support.

Should auxiliary functions be included in grid-connected PV inverters?

Auxiliary functions should be included in Grid-connected PV inverters to help maintain balance if there is a mismatch between power generation and load demand.

What is 65 grid forming inverter capability?

65 Grid forming inverter capability can improve BPS operation as inverter-based resource penetration increases, and its sole purpose is not only for 100%

inverter-based systems. During a blackstart emergency condition, units are generally not allowed to return without explicit instruction from the BA.

What is grid communication?

Much of grid communication is performed over purpose-built communication networks owned and maintained by grid utilities. Broadly speaking, grid communication systems are comprised of multiple transport technologies and protocols carried by a variety of media.
