

ContainerPower Energy Solutions

Solar panel power generation costs and profits

Overview

Solar farming can be profitable, with average returns of 10-15% annually. Initial setup costs range from \$800 to \$1,200 per kW of capacity while operating costs are typically low. Revenue depends on local energy prices and solar irradiance levels.

Solar farming can be profitable, with average returns of 10-15% annually. Initial setup costs range from \$800 to \$1,200 per kW of capacity while operating costs are typically low. Revenue depends on local energy prices and solar irradiance levels.

Each year, the U.S. Department of Energy (DOE) Solar Energy Technologies Office (SETO) and its national laboratory partners analyze cost data for U.S. solar photovoltaic (PV) systems to develop cost benchmarks. These benchmarks help measure progress toward goals for reducing solar electricity costs.

Economies of scale drive down per-watt costs, making utility-scale solar competitive with fossil fuel generation in many markets. Community solar offers a different approach, allowing individuals to purchase shares of larger solar installations. These projects typically range from 1-5 MW and serve.

NREL analyzes the total costs associated with installing photovoltaic (PV) systems for residential rooftop, commercial rooftop, and utility-scale ground-mount systems. This work has grown to include cost models for solar-plus-storage systems. NREL's PV cost benchmarking work uses a bottom-up.
