Long before the first Earth Day was celebrated on April 22, 1970, generating awareness about the environment and support for environmental protection, scientists were making the first discoveries in solar energy. It all began with Edmond Becquerel, a young physicist working in France, who in 1839.

The first silicon photovoltaic cell was created all the way back in 1954 Why trust EnergySage?

As subject matter experts, we provide only objective information. We design every article to provide you with deeply-researched, factual, useful information so that you can make informed home.

As early as 212 BC, the Greek scientist, Archimedes, used the reflective properties of bronze shields to focus sunlight and to set fire to wooden ships from the Roman Empire which were besieging Syracuse. (Although no proof of such a feat exists, the Greek navy recreated the experiment in 1973 and.

In 1767, Swiss scientist Horace de Saussure created the first solar collector—a series of glass boxes nested inside one another. When exposed to sunlight, the innermost box could reach temperatures over 100 degrees Celsius, making it effectively an early solar oven. French physicist Edmond.

The first time that solar seemed like a “better option than fossil fuels ” was during the oil embargo of 1973 when gas shortages were rampant within the U.S. Interest in energy independence grew and with it, the beginning of solar

incentives came to be. Years later, to help boost the economy and.

The idea of solar power began in 1839 when French scientist Edmond Becquerel discovered the photovoltaic effect, which is how sunlight can generate electricity. The 1950s brought the first practical solar cells made from silicon, which were a major breakthrough despite their limited efficiency of.
