Which side of a bifacial solar panel generates more power

Overview

Bifacial solar panels have glass on both sides, increasing power production from exposure on the backside. How bifacial solar panels work?

Ground Reflectivity: The back side of bifacial solar panels can utilize reflected light from the ground for power generation. The higher the ground reflectivity, the stronger the light received by the back side, leading to better power generation performance.

Do bifacial solar panels produce more power?

Bifacial solar panels have glass on both sides, increasing power production from exposure on the backside. Real-world tests show that bifacial panels outperform regular panels, even with the backside blocked. Bifacial panels on a white roof produced 11-16% more power than standard panels.

What is bifacial solar technology?

Therefore, we can say that bifacial technology is a relatively new development in solar panel design that presents both opportunities and challenges. Bifacial solar modules are modules that generate energy on both their front and rear sides, based on solar cells with two active sides.

Which bifacial solar panel is best?

Renogy 220W Bifacial Solar Panel: This panel is efficient and versatile, suitable for various applications from rooftops to side awnings to a portable ground panel. It can generate power from both sides, capturing as much sun as possible. **Talesun 400W Bifacial Solar Panel:** Talesun is a well-known Tier-1 brand in the solar market.

Do bifacial solar panels absorb sunlight?

However, it's important to note that even though both surfaces of bifacial panels can absorb sunlight and heat for energy production, the front side absorbs more sunlight than the backside. With bifacial solar panels, you can

increase your energy generation by as much as 30%.

Are bifacial panels a monofacial?

Monofacial modules usually include a solid backsheet which blocks any possibility of light capturing on the rear side. However, with bifacial panels, the back side requires a translucent material that allows sunlight to pass through. Many bifacial panel designs, including Trina Solar's, use a double glass structure for this purpose.
