Wind solar storage and transmission multi-energy complementarity

Overview

Wind-solar-hydro-storage multi-energy complementary systems, especially joint dispatching strategies, have attracted wide attention due to their ability to coordinate the advantages of different resources and enhance both flexibility and economic efficiency. Can multienergy complementarity improve the consumption of wind and solar energy?

However, the problem of wind and solar energy curtailment due to their inherent randomness and fluctuation remains to be solved. Multienergy complementary operation based on the complementarity between different renewable energy units is an important means to improve the consumption.

What is a multi-energy complementary system?

Overall Structural Framework of the Model The wind-solar-hydro-storage multi-energy complementary system is an intelligent coordinated energy supply system that integrates multiple energy forms such as wind energy, solar energy (hydropower, photovoltaic), hydropower, and electrochemical energy storage.

Should solar and wind complementarity be prioritized?

On a broader scale, a global analysis of solar and wind complementarity using Kendall's Tau correlation and hybrid generator sizing coefficients suggested that in tropical and subtropical regions, solar energy should be prioritized to minimize storage dependence, offering new insights into energy planning for hybrid systems .

What is wind-solar complementarity?

Wind-solar complementarity utilizes the complementarity of wind energy and solar energy, and realizes the stable operation of power system by rationally allocating the power generation plan of the two energy sources. This model has a broad application prospect in areas with suitable resource conditions.

What is complementarity in energy management?

Complementarity refers to the potential of combining various energy sources to offset the limitations of one source, thereby minimizing fluctuations in energy supply and ensuring a more consistent power output. This approach utilizes the distinct characteristics of RESs to enhance system performance .

Does energy complementarity exist between Hydro and wind resources?

Among these studies, several focus specifically on the complementarity between hydro and wind resources. For example, in Brazil, one study utilized correlation maps to portray energy complementarity between hydro and wind sources, indicating localized results that may not be generalizable to other regions .
